Confidential. Do not disseminate. This plan contains confidential, trade-secret information and may not be shared without written consent.

Executive Summary

SpeedSearch is an innovative SaaS platform designed to revolutionize how undergraduate students discover research opportunities and how faculty recruit talent at universities. The platform addresses the significant inefficiencies and mismatches prevalent in the modern undergraduate research landscape, where students often face time-consuming search processes and struggle to find opportunities that truly align with their interests and skills.

Our solution centralizes publicly available research project information from various university sources, creating a comprehensive and up-to-date database. Students create detailed profiles, which our proprietary intelligent matching algorithm uses to connect them with highly relevant research opportunities, moving beyond generic keyword searches to focus on contextual fit. This streamlines the discovery process, minimizes frustration, and fosters more productive student-mentor relationships.

SpeedSearch is currently targeting R1 universities, institutions recognized for the highest research activity, where the need for an efficient research placement system is most acute. While R2 and R3 universities represent future expansion opportunities, our immediate focus is on penetrating the R1 market, comprising approximately 187 institutions in the U.S. Our marketing plan emphasizes organic student acquisition through campus engagement and targeted digital outreach, while administrator acquisition employs an account-based strategy, directly engaging decision-makers like Vice Provosts for Research and Deans of Undergraduate Research with customized demos.

The sales strategy is pilot-first, aiming for three to five university contracts in Year 1 priced below published rates in exchange for product roadmap influence and future referrals. We plan to shorten the typical university sales cycle by leveraging warm introductions at our founding institution, applying for the E&I Cooperative Services approved-vendor list, and offering a free 30-day trial. SpeedSearch operates as a Delaware C-Corporation, currently self-funded by its four co-founders, Aadharsh S., Ted E., Ali S., and Chima O., who bring expertise in strategy, design, research, and AI model development, respectively. Our remote-first operational model defers significant facility costs, preserving capital for product development and marketing.

The technology underpinning SpeedSearch is evolving from a local-first prototype to a multi-tenant SaaS platform deployed on AWS, prioritizing data privacy and FERPA compliance through dedicated databases and zero-data-retention agreements for AI models. Key metrics for success include Annual Recurring Revenue, Net Revenue Retention of 110%, and a Customer Acquisition Cost under $5,000, alongside critical usage and quality metrics such as a 15% undergraduate installation rate per pilot institution and an 8% acceptance rate for top-5 matched research positions.

Confidential. Do not disseminate. This plan contains confidential, trade-secret information and may not be shared without written consent.

We are actively cultivating a diverse network of advisors, including academic research experts, SaaS industry veterans, and AI/ML specialists, to guide our growth and ensure our platform remains cutting-edge, ethically sound, and compliant with all relevant regulations.

Confidential. Do not disseminate. This plan contains confidential, trade-secret information and may not be shared without written consent.

Opportunity

Problem Worth Solving

Problem Worth Solving

The modern undergraduate research landscape presents significant hurdles for students seeking meaningful lab experiences and for faculty looking to recruit talented researchers. SpeedSearch addresses two critical problems:

1. **Inefficient and Time-Consuming Search Processes:** Premedical and other research-focused students often face a tedious and overwhelming process when searching for research opportunities. This typically involves navigating numerous faculty and lab websites, departmental catalogs, and university portals, each with varying levels of detail and outdated information. This fragmented approach leads to countless hours spent sifting through irrelevant information, causing frustration and often resulting in students missing out on suitable opportunities simply because they are difficult to find.
2. **Mismatched Opportunities:** Beyond the sheer volume of information, students struggle to identify labs and projects that genuinely align with their specific academic interests, skill sets, and prior experience. Generic keyword searches often yield broad results, failing to provide the contextual fit necessary for a productive student-mentor relationship and a valuable research experience. This mismatch can lead to wasted time for both students and faculty, as well as a higher turnover rate in research positions.

Existing solutions largely fail to provide a centralized, intelligent matching system designed specifically for the nuances of academic research. Generic job boards or university career services platforms are often optimized for internships and traditional employment, not for the specialized nature of faculty-led research. This leaves a significant gap in the market for a solution that can streamline the discovery process and ensure better alignment between student aspirations and available research projects.

Our Solution

SpeedSearch addresses the inefficiencies and mismatches in undergraduate research by providing a centralized, intelligent platform. Our solution begins by systematically gathering publicly available information on research projects from faculty websites, lab websites, and university catalogs across campus. This extensive dataset forms the foundation of our platform, ensuring that students have access to a comprehensive and up-to-date repository of opportunities.

Confidential. Do not disseminate. This plan contains confidential, trade-secret information and may not be shared without written consent.

Students engage with SpeedSearch by creating detailed profiles where they input their academic interests, specific skills, and prior experiences. This information is crucial for our proprietary matching algorithm, which then processes these student profiles against the vast database of available research projects. The algorithm is designed to go beyond simple keyword searches, focusing instead on contextual fit to identify opportunities that truly align with a student's qualifications and aspirations.

The core of our offering is this intelligent matching system, which streamlines the discovery process for students and ensures that they are presented with highly relevant research opportunities. This eliminates the need for students to spend countless hours sifting through fragmented information across various university sources. By providing a curated list of suitable projects, SpeedSearch minimizes frustration and maximizes the likelihood of students finding valuable research experiences that foster productive student-mentor relationships.

Target Market

Target Market

SpeedSearch's primary target market consists of universities, specifically focusing on R1 institutions. These universities are designated by the Carnegie Classification of Institutions of Higher Education as having the highest research activity, making them ideal customers due to their abundant research opportunities for undergraduate students. The substantial volume of research conducted at R1 universities directly correlates with a greater need for an efficient system to connect students with faculty research, addressing the core problem SpeedSearch solves. While R1 universities represent the initial and most strategic segment, R2 and R3 universities also present viable opportunities for future expansion. R2 universities are classified as having high research activity, and R3 institutions have moderate research activity. Although these segments may have fewer research opportunities compared to R1 institutions, they still face the challenge of connecting students with available research positions, making them potential customers. However, the immediate focus for SpeedSearch's market penetration and growth strategy will remain on the R1 segment, where the problem is most acute and the potential impact is greatest. Within these university segments, the key decision-makers and influencers include Vice Provosts for Research, Deans of Undergraduate Research, and IT procurement contacts. These individuals are responsible for enhancing research output, supporting student academic development, and approving technological solutions, respectively. Our understanding of their needs informs our sales and marketing efforts, ensuring that our platform's value proposition—streamlining research placement and improving student engagement—resonates directly with their institutional priorities. The current market includes approximately 187 R1 universities in the U.S., representing a significant initial opportunity for SpeedSearch to establish its presence and demonstrate value.

Confidential. Do not disseminate. This plan contains confidential, trade-secret information and may not be shared without written consent.

Competition

Since SpeedSearch is a nascent platform, direct competitors offering a centralized, multi-university research matching solution for undergraduates are not yet prevalent. However, indirect competition exists primarily through individual university-specific platforms and the traditional methods students currently employ to find research opportunities. An example of a localized direct competitor is the Research Match platform at the University of New Mexico, which serves a similar purpose but is confined to a single institution.

The most significant indirect alternative for students seeking research is the laborious process of manually scrolling through university catalogs, departmental websites, and faculty pages. This approach is incredibly time-intensive, often yielding incomplete results, and can be frustrating due to fragmented or outdated information. Students frequently miss out on suitable opportunities simply because they are difficult to discover through these traditional, decentralized methods.

SpeedSearch's competitive advantage lies in its ability to centralize and streamline the undergraduate research search process across numerous campuses. Our platform offers a significantly less time-intensive and tedious alternative to manual catalog searches. By aggregating opportunities from various universities, SpeedSearch provides a comprehensive national database, allowing students from around the country to find relevant research opportunities with unprecedented ease. Furthermore, our intelligent matching algorithm ensures greater accuracy in connecting students to projects that align with their interests, skills, and experience. This prevents students from overlooking valuable opportunities that might be missed during a solitary, manual search, ultimately providing a superior and more efficient solution for both students and faculty.

Confidential. Do not disseminate. This plan contains confidential, trade-secret information and may not be shared without written consent.

Execution

Marketing Plan

SpeedSearch is a research-matching platform that connects undergraduate students with faculty research opportunities at their university. The product is sold to universities, but students are the ones who use it daily. Both audiences need to be reached, and they require different approaches.

Student acquisition is organic. At NJIT, the founding team tables at the Highlander Hub, presents to student chapters like ACM, IEEE, SWE, and the Albert Dorman Honors College. These are the organizations where research-interested students already gather. Beyond campus events, department newsletters and honors program listservs put the product in front of targeted students at no cost. On social media, the focus is LinkedIn and university-specific forums, where short demo videos and posts explain the problem SpeedSearch solves. The entire student-facing channel runs on founder time, not paid spend.

Administrator acquisition is account-based. The target list is the 187 R1 research universities designated in the 2025 Carnegie classification. For each school, outreach goes to three people: the Vice Provost for Research, the Dean of Undergraduate Research, and the vendor-approval contact in the IT office. Each email includes a short recorded walkthrough showing SpeedSearch applied to that school's own research pages, so the value is immediately visible and specific to their institution.

The 2026 marketing budget is $12,000 and covers four things: Google Workspace for professional email and calendar, HubSpot Starter CRM for pipeline tracking, a booth at the Council on Undergraduate Research national meeting (the primary annual gathering of undergraduate research administrators), and LinkedIn sponsored posts filtered by job title to reach decision-makers at target schools.

Positioning is simple: SpeedSearch does for university research what Indeed does for job search, except it matches students to opportunities based on contextual fit rather than keyword overlap. This separates SpeedSearch from platforms like Handshake, which is built for jobs and internships, not faculty research placement.

Sales Plan

The sales motion is pilot-first. Year 1 targets three to five universities at $10,000 to $15,000 each, totaling the $52,500 revenue projection in the financial plan. These pilot contracts are intentionally priced below the published rate.

Confidential. Do not disseminate. This plan contains confidential, trade-secret information and may not be shared without written consent.

In exchange for the discount, pilot schools get influence over the product roadmap and agree to two things: participate in a reference call for future prospects, and convert to full pricing in year 2.

The sales cycle at a university typically runs six to nine months because of procurement committees, legal review, and budget cycles. SpeedSearch shortens this in three ways.

First, the founding team starts at NJIT, where three of four founders are current students and where warm introductions to the Office of Undergraduate Research are reachable through faculty advisors. Second, the team applies in Q1 2026 to the E&I Cooperative Services approved-vendor list. E&I is a nonprofit purchasing cooperative with over 6,000 member institutions, and many state-school procurement offices will not sign with a vendor who is not already on a cooperative list. Getting on E&I removes a major friction point. Third, SpeedSearch offers a free 30-day trial that requires no contract, no legal review, and no purchase order. The trial runs on a small number of devices inside one department. The usage data from that trial becomes the evidence quoted back to procurement when it is time to close.

The conversion path is explicit: free trial, then pilot contract ($10,000 to $15,000 for one semester), then full annual license at tiered pricing based on enrollment. Under 10,000 students: $15,000 per year. Between 10,000 and 25,000 students: $30,000 per year. Over 25,000 students: $50,000 per year.

Year 2 layers 10 to 15 new schools on top of pilot conversions to reach $262,500. Year 3 scales to roughly 30 institutions at blended pricing to reach $1,312,500. Expansion revenue inside a signed account comes from add-on modules on the roadmap: an analytics dashboard for research offices, integrations with learning management systems and student information systems, and a graduate-admissions variant.

No dedicated salesperson is hired in 2026. The four founders split outreach by region. The first sales hire is triggered only after two annual contracts renew without founder intervention.

Locations & Facilities

SpeedSearch is remote-first. The product is software. It does not require a lab, a warehouse, or retail space. The four founders work from their dorms and apartments and meet on NJIT's campus two to three times per week, rotating between Littman Library group-study rooms, the Makerspace lounge, and the Campus Center. When a customer demo or design-partner meeting requires a professional setting, the team uses the NJIT VentureLink incubator, which is free to NJIT-affiliated founders and provides conference rooms, a mailing address, and introductions to alumni investors. VentureLink is the largest startup incubator in New Jersey at 110,000 square feet.

Confidential. Do not disseminate. This plan contains confidential, trade-secret information and may not be shared without written consent.

This is a cost decision, not a limitation. Office leases in Newark run $25 to $45 per square foot per year. A four-person office would cost $15,000 to $25,000 annually, which is roughly half of projected 2026 revenue. Spending that before the product has proven itself would be reckless. Deferring a lease until year 3, when cash flow supports it without cutting into marketing or product budgets, preserves capital for the things that actually grow the business.

For credibility with university procurement offices, three substitutes cover the same ground as a physical office. The VentureLink address on the company's contact page. A Delaware C-corp registered-agent address on legal documents. A Google Workspace domain with real email routing and calendar. Combined, these cost under $500 per year.

When the team grows beyond the four founders, the plan is a co-working membership at a flexible space like WeWork Newark or Regus Morristown, month-to-month, with no long-term lease. A traditional office lease will not be signed until there are at least twelve full-time employees.

Technology

The current prototype is a local-first system. A Chrome extension scrapes faculty and lab web pages, sends the text to a backend running on the user's own machine, and a locally hosted language model scores the match between the student's profile and each research opportunity. Data is stored locally in SQLite. A scheduled job emails professors every two days to confirm whether listed positions remain open. Nothing leaves the user's machine. That is the current privacy story and the basis for FERPA compliance.

The codebase is open source under GPL v3, with a dual-licensing option for institutions that cannot accept copyleft. Keeping the core open is deliberate. University IT and legal offices can audit the code line by line before approving a pilot, which speeds up vendor review. It also generates inbound interest from computer science students who fork the repository and invite the team to their own campuses.

The production architecture planned for 2027 moves away from local inference. It becomes a multi-tenant software-as-a-service platform deployed on AWS, with a dedicated Postgres database per institution on Amazon RDS and pgvector for storing profile embeddings. The matching model shifts to a hosted API under a zero-data-retention agreement, which provides stronger reasoning than a small local model while preserving the privacy guarantees FERPA requires. For schools that refuse any external model call, a self-hosted fallback is available using an open-weight model running inside the school's own cloud environment.

Authentication will use SAML 2.0 and OpenID Connect through Shibboleth, which is the standard single

Confidential. Do not disseminate. This plan contains confidential, trade-secret information and may not be shared without written consent.

sign-on protocol across universities. Integration with learning management systems uses the LTI 1.3 standard against Canvas. Integration with student information systems uses Ellucian Ethos APIs. The browser extension remains one access point, but a web application will also be available for institutions that restrict browser extensions.

On the compliance side, SOC 2 Type I readiness begins in year 2 and Type II in year 3. WCAG 2.2 AA accessibility audits ship with every release. Bias audits on the matching algorithm are conducted once per academic year by a qualified third-party auditor and published in a model card alongside each release.

Equipment & Tools

No company hardware is required in 2026. The prototype runs on any modern computer with at least 8 GB of RAM, which means the founding team can develop and test the product end-to-end on personal machines without a cloud bill.

Software tooling is deliberately minimal. Source control and continuous integration run on GitHub Team at $4 per user per month. Domain and DNS are on Cloudflare for under $20 per year. Transactional email is on Postmark, free through 100 emails per month and $15 per month after that. Design uses Figma's free tier. Documentation uses Notion's free tier. Project management runs through GitHub Issues rather than a paid tool. Google Workspace Business Starter at $7.20 per user per month handles custom-domain email, shared drive, and calendar. Total fixed software cost in 2026 is under $80 per month.

For the production build in 2027, the stack adds AWS infrastructure (Route 53, ECS Fargate, RDS Postgres, S3, CloudFront), API usage for the matching model, Sentry for error monitoring, PostHog for product analytics, Stripe for invoicing, and the HubSpot CRM seat. To offset these costs, SpeedSearch applies to AWS Activate before sending its first paid invoice. The Founders package provides $1,000 in credits immediately. The Portfolio package, available through an affiliated accelerator or VC, provides up to $100,000. These credit programs are designed to cover the bulk of early infrastructure costs and are the reason direct costs stay under $7,500 in year 2.

Equipment purchases that are deferred: office furniture, printers, a company laptop fleet, and networking hardware. Each of these is only justified after an office lease is signed, which is not happening until year 3.

Confidential. Do not disseminate. This plan contains confidential, trade-secret information and may not be shared without written consent.

Milestones

Publish open-source repository
Release the full codebase with documentation on GitHub under GPL v3 so university IT teams can audit the code during vendor review.

May 15, 2026

File for E&I Cooperative vendor approval
ubmit application to E&I Cooperative Services approved-vendor list to remove procurement friction at state schools.

June 30, 2026

Ship product to NJIT pilot group
Deploy the product to a controlled group of students and faculty in one NJIT department. Collect usage data to build the case for a formal contract.

June 30, 2026

Submit CUR 2027 conference proposal
Submit a proposal to present at the Council on Undergraduate Research national meeting in Grand Rapids, Michigan, April 12 to 14, 2027.

Oct 31, 2026

NJIT pilot contract
Convert the informal NJIT deployment into a signed pilot agreement at $10,000 to $15,000 for one semester.

Dec 31, 2026

Publish first case study
Write and publish a case study using NJIT usage data showing adoption rates, match quality, and professor response rates.

Feb 27, 2027

Close two external pilot contracts
Sign pilot agreements with two universities outside NJIT using the case study and CUR conference as lead generators.

June 30, 2027

Confidential. Do not disseminate. This plan contains confidential, trade-secret information and may not be shared without written consent.

Reach 30 signed institutions

Scale to 30 or more paying universities. Evaluate a Series A raise based on annual recurring revenue and renewal rate.

Dec 31, 2028

Key Metrics

Revenue metrics track three things: Annual Recurring Revenue, Net Revenue Retention at a target of 110%, and Customer Acquisition Cost under $5,000 per institution. At a blended annual price of $30,000, that holds a ratio of roughly 1-to-6 between what it costs to acquire a customer and what that customer is worth over time. These are standard SaaS health indicators, but the metrics that actually predict whether SpeedSearch works sit upstream of revenue.

Usage metrics are tracked weekly. Installs per pilot institution, with a target of 15% of the undergraduate population within one semester. Weekly active users as a percentage of installs, target 40%. Average matches scored per active user per week, target 8 or more. Profile completion rate, target 75% of users finishing their profile within seven days of signing up.

Quality metrics are tracked monthly. Match-outcome rate measures two things: the fraction of top-5 matches a student actually contacts, and the fraction of those contacts that convert into an accepted research position. This is the single number that proves contextual matching works better than keyword search, and it is the number presented to research administrators at renewal time. Targets: 25% contact rate on top-5 matches and 8% acceptance rate, against an estimated baseline closer to 2% for cold outreach.

Operational metrics are tracked monthly. Professor confirmation response rate, target 35%. Stale-opportunity removal rate, target 90% of closed positions removed from the platform within 30 days. Model response time at the 95th percentile under 4 seconds per opportunity score.

Trust metrics are tracked quarterly. Zero privacy incidents. FERPA audit-trail completeness at 100%. WCAG 2.2 AA compliance maintained through every release. An algorithmic-bias audit delivered once per academic year by a qualified third-party auditor.

All of these are reported on a single dashboard for design-partner schools and on a password-protected, per-institution dashboard for paying customers. Making the numbers visible is itself a sales tool. No competitor in this space publishes anything comparable.

Confidential. Do not disseminate. This plan contains confidential, trade-secret information and may not be shared without written consent.

Company

Ownership & Structure

Ownership & Structure

SpeedSearch is structured as a Delaware C-Corporation, a legal entity chosen to facilitate future investment and provide liability protection for its founders. This structure allows for clear ownership delineation and scalability as the company grows.

The company is currently owned by its four co-founders, each holding an equal stake in the business:

- **Aadharsh S.** - Founder, responsible for overall strategy and team leadership.
- **Ted E.** - Design lead, specializing in systems design and user experience.
- **Ali S.** - Research lead, bringing expertise in biomedical research and academic insights.
- **Chima O.** - Technical lead, with extensive experience in AI model development.

As a startup, the founders are actively involved in all aspects of the business, from product development and marketing to sales and strategic partnerships. The C-Corporation structure provides the flexibility needed to issue shares to future investors or employees as SpeedSearch expands its operations and secures additional funding.

Management Team

The Management team includes: Aadharsh.S, Ted E., Ali S. and Chima O.

- Aadharsh S. - Founder and strong background in leading and managing teams especially in winning international competitions.
- Ted E. - Strong systems thinking and background in design
- Ali S. - A biomedical major with strong experience in research
- Chima O. - Extensive background in working with AI models and technical lead.

Confidential. Do not disseminate. This plan contains confidential, trade-secret information and may not be shared without written consent.

Advisors

Advisors

As a startup, SpeedSearch recognizes the invaluable role of external guidance and mentorship in navigating the complexities of launching and scaling a technology platform within the higher education sector. Our team is actively cultivating relationships with a diverse group of advisors who offer specialized expertise across key areas critical to our success.

- **Academic Research & Administration Experts:** Given our focus on the undergraduate research landscape, we are seeking advisors with extensive experience as Vice Provosts for Research, Deans of Undergraduate Research, or tenured faculty who have managed large research programs. These individuals can provide critical insights into university procurement processes, faculty needs, student engagement strategies, and the institutional priorities that drive technology adoption in research administration. Their understanding of the target market's pain points and decision-making frameworks will be crucial for refining our product roadmap and sales approach.
- **SaaS & EdTech Industry Veterans:** We aim to connect with seasoned entrepreneurs and executives from the Software-as-a-Service (SaaS) and Education Technology (EdTech) sectors. Advisors with a proven track record in building and scaling B2B software companies, particularly those serving universities, can offer guidance on product-market fit, pricing strategies, customer acquisition at scale, and navigating the unique sales cycles prevalent in academic institutions. Their experience in optimizing user experience and ensuring platform security and compliance will also be highly valuable as we transition from prototype to a multi-tenant SaaS solution.
- **AI/ML & Data Privacy Specialists:** As our solution relies on an intelligent matching algorithm and processes sensitive student data, advisors with deep expertise in AI/Machine Learning ethics, data privacy (especially FERPA compliance), and robust system architecture are essential. These experts will help us ensure our technology remains cutting-edge, ethically sound, and fully compliant with all relevant regulations, which is a significant selling point for university clients.
- **Early-Stage Investor Mentors:** We are also engaging with mentors who have experience in early-stage venture capital or angel investing. These individuals can provide strategic advice on fundraising, financial modeling, and preparing for future investment rounds, ensuring we build a scalable and attractive business model.

When faced with an important question or a new business challenge, our approach is to leverage this network of advisors strategically. For instance, questions regarding university-specific compliance or institutional sales strategies would be directed to our academic and EdTech advisors, while technical architectural decisions or privacy concerns would be routed to our AI/ML and data privacy specialists.

Confidential. Do not disseminate. This plan contains confidential, trade-secret information and may not be shared without written consent.

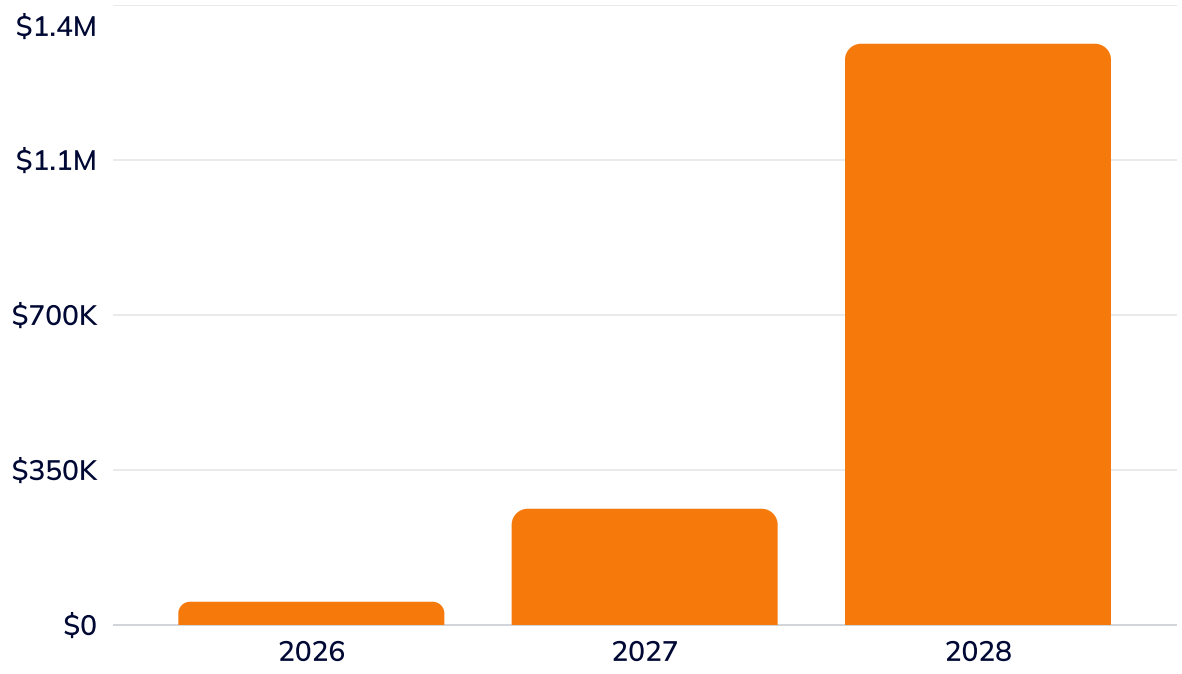
This targeted approach ensures that we receive informed, relevant, and actionable advice to guide SpeedSearch's growth.

Confidential. Do not disseminate. This plan contains confidential, trade-secret information and may not be shared without written consent.

Financial Plan

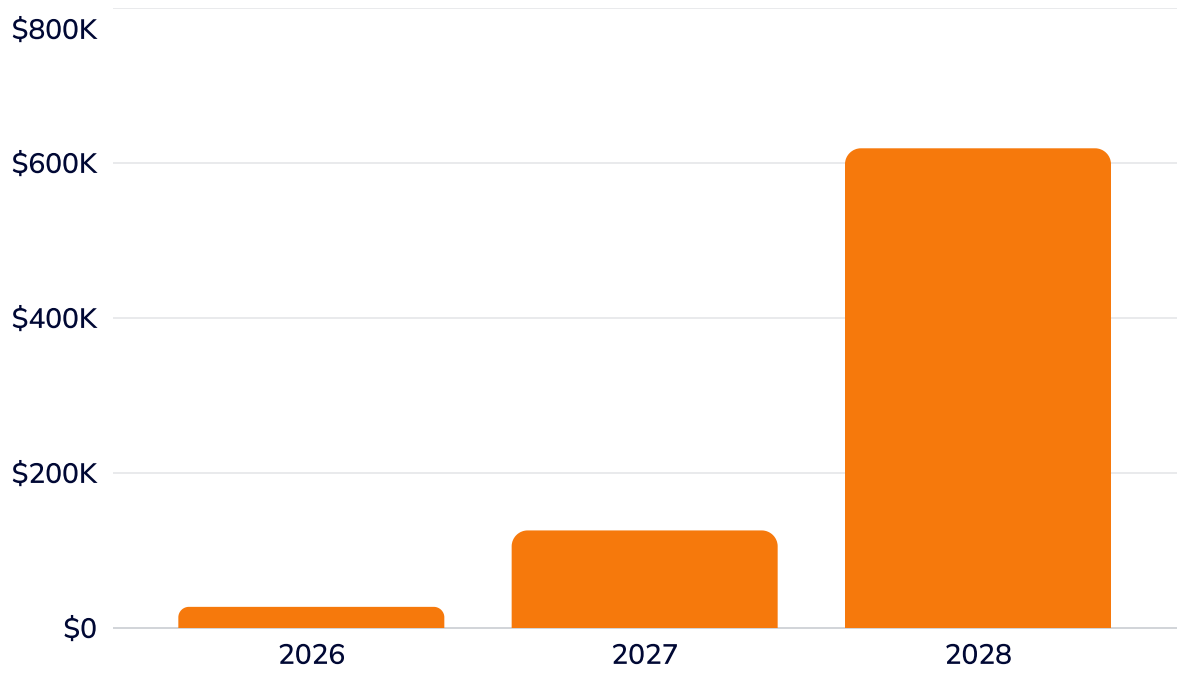
Revenue

Revenue by Year



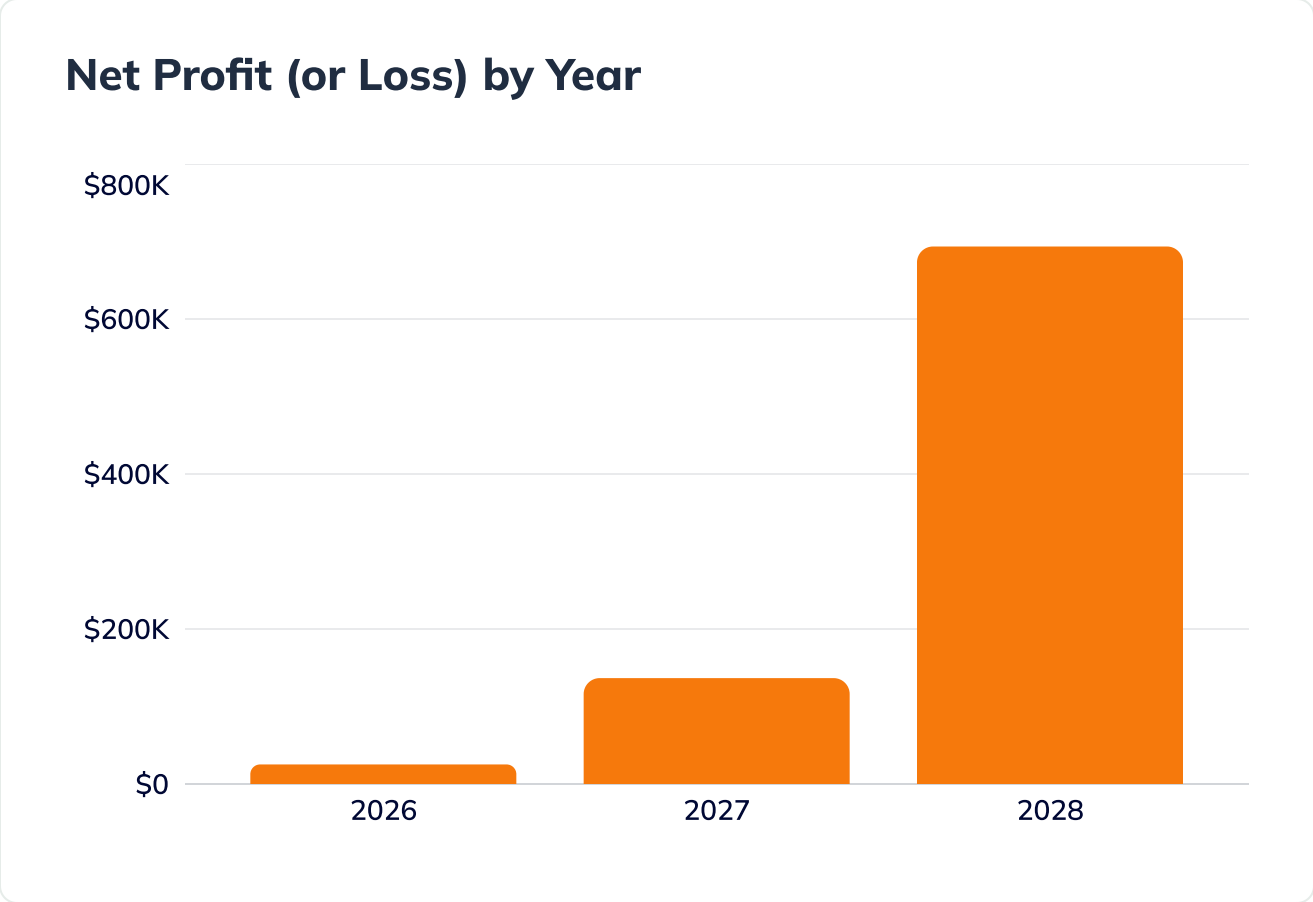
Expenses & Costs

Expenses by Year



Confidential. Do not disseminate. This plan contains confidential, trade-secret information and may not be shared without written consent.

Profitability



Use of Funds

- Four founders' salaries: At first, we won't have enough cashflow to pay ourselves. Once cashflow grows strong enough, we will be able to start paying ourselves.
- Product Improvement: We will be able to create an MVP ourselves for little cost. Once our business becomes profitable enough, we will invest money into improving our website and algorithm to produce a cutting-edge product.
- Marketing: We will increase the marketing budget each year as far as our funds allow to create a recognizable brand.
- Networking: We will create a networking division to get our company into conferences at universities across the country.

Confidential. Do not disseminate. This plan contains confidential, trade-secret information and may not be shared without written consent.

Sources of Funds

As a startup, SpeedSearch is currently self-funded by its four founders, leveraging personal savings and resources to cover initial development and operational expenses. We are committed to bootstrapping the company, funding its growth through its own profits, and minimizing external debt or equity dilution in the early stages.

Our initial capital investment from the founders is allocated towards:

- Developing the Minimum Viable Product (MVP) for our website.
- Obtaining and hosting our website domain.
- Initial marketing efforts to establish brand presence among our target demographic.

In the near future, we may also seek external sources of capital in the form of grants:

- NSF I-Corps: We can register SpeedSearch into NSF I-Corps and attend the info session on April 28th. We could obtain up to $1,500 dollars, enough to fuel the early stages of our startup.
- SBIR: Once we develop our MVP and finalize our commercial plan, we can apply for the federal SBIR grant for the possibility of a much larger reward of $50,000-$275,000.
- STTR: We may also be eligible for the federal STTR grant if we collaborate with the NJIT research department to develop our MVP.
